

6. Information Extraction with Azure AI Document Intelligence

Diving Deep Into Azure AI

→ Different methods to extract information from the documents using the pre-built models

- ➔ Create a custom AI model and provide feedback to improve the model's accuracy
- ➔ Deploy Azure AI service in the On-premises container

Prerequisites

- ➔ Azure Subscription
- ➔ Docker
- ➔ VS Code with Dev Containers extension
- ➔ Familiarity with:
 - ➔ Azure Services
 - ➔ Docker
 - ➔ Python
 - ➔ Jupyter Notebook

Github repository used:

<https://github.com/jamesmcraft/document-intelligence-user-feedback-processor>

<https://github.com/uzi4/document-intelligence-user-feedback-processor> - Forked repo

Azure AI Document Intelligence:

- ➔ AI service to build automated data processing software
- ➔ Uses Optical Character Recognition (OCR):
 - Text
 - Key/value pairs
 - Tables
- ➔ Pre-built Models:
 - Invoices
 - Receipts
 - Business cards
- ➔ Azure AI Document Intelligence is a machine learning-based service designed to automate data extraction from documents.

- ➔ **Pre-built Models:** These models are ready to use for extracting information from common document types like invoices, receipts, ID cards, and business cards.
- ➔ **Custom Models:** These models are trained on your own specific datasets to extract data from unique forms and documents
- ➔ **Service Tools:** You can interact with the service using the [Azure AI Document Intelligence Studio](#) for a GUI-based experience or via **SDKs** and REST APIs for programmatic access.

➔ Open Azure Ai website platform

➔ Then create Document intelligence and fill all the required details

➔ Then open document intelligence studio

➔ After opening document intelligence studio and use a prebuilt model for analyzing receipt

The screenshot displays the Azure AI Document Intelligence Studio interface. On the left, there's a sidebar with options like 'Drag & drop file here or Browse for files' and 'Run analysis'. The main area shows a receipt analysis result for a receipt from 'CORTADO'. The receipt details include the store name, address, and a table of items purchased.

Receipt Details:

- Store: CORTADO
- Address: 3059 Old Centre Road, Los Angeles, CA 90019, 90904-5219
- Thank you for your purchase! Your receipt details are included below.
- Receipt Number: 000002
- Receipt Date: 01/01/2020
- Item 1: 001
- Item 2: 002
- Item 3: 003
- Item 4: 004
- Item 5: 005
- Item 6: 006
- Item 7: 007
- Item 8: 008
- Item 9: 009
- Item 10: 010
- Item 11: 011
- Item 12: 012
- Item 13: 013
- Item 14: 014
- Item 15: 015
- Item 16: 016
- Item 17: 017
- Item 18: 018
- Item 19: 019
- Item 20: 020
- Item 21: 021
- Item 22: 022
- Item 23: 023
- Item 24: 024
- Item 25: 025
- Item 26: 026
- Item 27: 027
- Item 28: 028
- Item 29: 029
- Item 30: 030
- Item 31: 031
- Item 32: 032
- Item 33: 033
- Item 34: 034
- Item 35: 035
- Item 36: 036
- Item 37: 037
- Item 38: 038
- Item 39: 039
- Item 40: 040
- Item 41: 041
- Item 42: 042
- Item 43: 043
- Item 44: 044
- Item 45: 045
- Item 46: 046
- Item 47: 047
- Item 48: 048
- Item 49: 049
- Item 50: 050
- Item 51: 051
- Item 52: 052
- Item 53: 053
- Item 54: 054
- Item 55: 055
- Item 56: 056
- Item 57: 057
- Item 58: 058
- Item 59: 059
- Item 60: 060
- Item 61: 061
- Item 62: 062
- Item 63: 063
- Item 64: 064
- Item 65: 065
- Item 66: 066
- Item 67: 067
- Item 68: 068
- Item 69: 069
- Item 70: 070
- Item 71: 071
- Item 72: 072
- Item 73: 073
- Item 74: 074
- Item 75: 075
- Item 76: 076
- Item 77: 077
- Item 78: 078
- Item 79: 079
- Item 80: 080
- Item 81: 081
- Item 82: 082
- Item 83: 083
- Item 84: 084
- Item 85: 085
- Item 86: 086
- Item 87: 087
- Item 88: 088
- Item 89: 089
- Item 90: 090
- Item 91: 091
- Item 92: 092
- Item 93: 093
- Item 94: 094
- Item 95: 095
- Item 96: 096
- Item 97: 097
- Item 98: 098
- Item 99: 099
- Item 100: 100

- ➔ Click on analyze option and select analyzing options

- ➔ And click on run analyses
- ➔ And it will be extract information about the text present on receipt
- ➔ And code for extract code for extract detection information on local system

Incorporate Human feedback and Correction into the training Process

- ➔ Azure AI Document Intelligence Studio custom model
 - ➔ Implement a feedback mechanism to collect feedback and retrain the model
 - ➔ How to run a dev container and setup up required azure ai infrastructure:
 - ➔ Step 1: open command palette
 - ➔ Step 2: Search Dev container
 - ➔ Step 3: Then select the git repository folder where dev container folder is present
 - ➔ Step 4: open terminal and check host name
- ```
vscode → /workspaces/document-intelligence-user-feedback-processor (main) $ hostname
a61962c55d49
vscode → /workspaces/document-intelligence-user-feedback-processor (main) $
```
- ➔ Step 5: Setting up azure infrastructure

➔ Step 6: Logging to Azure AI account by using dev container using azure cli

```
vscode → /workspaces/document-intelligence-user-feedback-processor (main) $ az login --tenant
```

➔ Step 7 : file permission as new files can be created when running

```
vscode → /workspaces/document-intelligence-user-feedback-processor (main) $ sudo chmod -R 777 ../document-intelligence-user-feedback-processor/
```

➔ Step 8: Run a new powershell console and run new setup command for setting , this will start creating the required azure resources

```
PS /workspaces/document-intelligence-user-feedback-processor> ./Setup-Environment.ps1 -Deployme
ntName docintel-feedback-loop -Location centralus -SkipInfrastructure $true
Starting environment setup...
Deploying infrastructure...
Starting infrastructure deployment...
```

➔ Step 9 : then by using azure ai portal you can see many resources are being created

➔ Building a custom extraction model :

1. Import all the modules and libraries

```
import os

from dotenv import dotenv_values
from azure.identity import DefaultAzureCredential
from modules.app_settings import AppSettings
from modules.model_training_client import ModelTrainingClient
from modules.document_canvas import DocumentCanvas
from modules.document_intelligence_label import DocumentIntelligenceLabel
from modules.document_intelligence_result_formatter import DocumentIntelligenceResultFormatter
```

- Azure Authentication: The code uses DefaultAzureCredential from azure.identity, which is a common method for handling authentication across different Azure environments securely.
- Document Intelligence: It imports components (DocumentIntelligenceLabel, DocumentIntelligenceResultFormatter) related to analyzing and extracting data from documents using Azure AI services.

- c. Custom Modules: The code depends on local modules (modules.app\_settings, modules.model\_training\_client) to manage application configurations and handle custom model training logic
2. Then configuring Authentication :

```
working_dir = os.path.abspath('.')
settings = AppSettings(dotenv_values(f"{working_dir}/config.env"))
azure_credential = DefaultAzureCredential(
 exclude_environment_credential=True,
 exclude_managed_identity_credential=True,
 exclude_shared_token_cache_credential=True,
 exclude_interactive_browser_credential=True,
 exclude_powershell_credential=True,
 exclude_visual_studio_code_credential=False,
 exclude_cli_credential=False
)
```

- a. Credential Source: It uses DefaultAzureCredential, which attempts to authenticate using various methods in a specific order .
  - b. Excluded Methods: The configuration explicitly disables several methods, including environment variables, managed identities, shared token caches, interactive browser login, and PowerShell credentials.
  - c. Enabled Methods: It only allows authentication via Visual Studio Code and Azure CLI credentials.
  - d. Configuration File: The AppSettings object is populated using a .env file located in the current working directory
3. This sets the model name and version number:

```
The name of the model
model_name = 'invoices'

The version of the model
initial_model_version = '1.0.0'

The name of the model that will be registered in Azure AI Document Intelligence
initial_model_id = f"{model_name}-{initial_model_version}"

✓ 0.0s
```

4. Creating model client

```
model_training_client = ModelTrainingClient(settings=settings, use_azure_credential=False, azure_credential=azure_credential)
```

- a. Initialization: It sets up the client using a configuration object called settings.
- b. Authentication: The parameter use\_azure\_credential=False suggests it is skipping default automatic authentication methods, such as those relying on DefaultAzureCredential().
- c. Credentials: Instead, it explicitly passes an authentication object, azure\_credential, to manage permissions for connecting to the Azure ML workspace

5. Uploads the training data and create model by using intelligence:

```
model_training_client.delete_training_data("Invoice_6")

Uploads the initial training set to Azure Blob Storage and initiates model training using the upl
model_training_client.upload_training_data(f"{working_dir}/model_training")
invoice_model = model_training_client.create_model(model_name=initial_model_id)
```

- `delete_training_data`: This method is used to remove specific data from a training set in Azure Blob Storage before starting a new training run.
  - `upload_training_data`: This line uploads training documents from a local directory (specified by `working_dir`) to Azure Blob Storage, preparing them for the model training process.
  - `create_model`: This command initiates the training of a new machine learning model using the data just uploaded, assigning it a specific `initial_model_id`.
6. Then you can check azure ai platforms storage browser and be able to see that training data is being uploaded

- Then setting up the file and storage structure
- Then analyzing layout of documents when training a custom model in Azure AI document Intelligence
- Then running a script that Generates corresponding ocr file

```
For providing the feedback, the user would perform their analysis using your initial model.
model_training_client.run_layout_analysis(pdf_path, pdf_feedback_path, initial_model_id)
```

10. Analyses

11. Then displaying the document analyzed by initial training model

```
doc_canvas = DocumentCanvas(working_dir)

canvases = doc_canvas.load_pdf(pdf_path, document_fields_path, pdf_feedback_path)
for canvas in canvases:
 display(canvas)
✓ 1.6s
```

12. Taking human feedback

13. Then once the feedback is being generated , the rendered the information of label entered

```
labels = [DocumentIntelligenceLabel(label_region, doc_canvas.fields) for label_region in doc_canvas.get_document_labels()]
call (Ctrl+Alt+Enter)
for label in labels:
 display(label.render())
```

- a. `doc_canvas.get_document_labels()`: This function call likely retrieves a set of labeled regions (bounding boxes or text spans) previously defined for a document.List
- b. Comprehension: The code constructs a list called `labels` by iterating through each `label_region` retrieved from the document canvas.
- c. `label.render()`: This method is called to display the visual representation of each label, which typically means drawing bounding boxes around the identified document fields.

14. Creating json file with updated values

```
DocumentIntelligenceResultFormatter.save_to_labels_json(labels, pdf_file_name, pdf_labels_path)
```

15. Then creating a new training model by using the new updated value that was formatted

```
The version of the updated model, in this example, a minor change by adding a new training doc
updated_model_version = "1.1.0"

The name of the model that will be registered in Azure AI Document Intelligence
updated_model_id = f"{model_name}-{updated_model_version}"

Uploads the updated user feedback documents to Azure Blob Storage and initiates model training
model_training_client.upload_training_data(pdf_dir)
updated_model = model_training_client.create_model(model_name=updated_model_id)
```

- a. Model Versioning: The code defines a new version number (e.g., "1.1.0") and creates a unique model ID by combining the base model name with this new version.
- b. Data Upload: It uses a client to upload training documents (PDFs) from a specified local directory to Azure Blob Storage.
- c. Model Training: The `create_model` function is then called to initiate the training process on the Azure service using the newly uploaded data

## 16. Analyse the file with new training model

```
The file path to where the updated analysis of the user feedback document will be stored.
pdf_updated_analysis_path = os.path.join(pdf_dir, f"{pdf_file_name}.ocr_{updated_model_version}.json")

Run layout analysis with the updated model
model_training_client.run_layout_analysis(pdf_path, pdf_updated_analysis_path, updated_model_id)
```

## 17. The display the result

### Deploy Document Intelligence Service on the On-premises Container

- ➔ Container will allow you to run document intelligence system on your own network

**Recommended CPU cores and memory**

**Note**  
The minimum and recommended values are based on Docker limits and *not* the host machine resources.

**Document Intelligence containers**

Expand table

| Container        | Minimum               | Recommended           |
|------------------|-----------------------|-----------------------|
| Read             | 8 cores, 10-GB memory | 8 cores, 24-GB memory |
| Layout           | 8 cores, 16-GB memory | 8 cores, 24-GB memory |
| Business Card    | 8 cores, 16-GB memory | 8 cores, 24-GB memory |
| General Document | 8 cores, 12-GB memory | 8 cores, 24-GB memory |
| ID Document      | 8 cores, 8-GB memory  | 8 cores, 24-GB memory |
| Invoice          | 8 cores, 16-GB memory | 8 cores, 24-GB memory |
| Receipt          | 8 cores, 11-GB memory | 8 cores, 24-GB memory |
| Custom Template  | 8 cores, 16-GB memory | 8 cores, 24-GB memory |

- Each core must be at least 2.6 gigahertz (GHz) or faster.
- Core and memory correspond to the `--cpus` and `--memory` settings, which are used as part of the `docker compose` or `docker run` command.

- ➔
- ➔ You can deploy this container option on your network
- ➔ Deploying Read container

➔ Then running docker run command

```
docker run -d \
 --name DocIntelLocal \
 -e EULA=accept \
 -e billing= \
 -e apiKey= \
 -e AzureCognitiveServiceLayoutHost=http://DocIntelLocal:5000 \
 -p 5000:5000 \
 mcr.microsoft.com/azure-cognitive-services/form-recognizer/read-3.1
```

- Image: It pulls the container image form-recognizer/read-3.1 from the Microsoft Container Registry (MCR).
- EULA: By setting -e EULA=accept, you are agreeing to the End User License Agreement required to run the container.
- Networking: The -p 5000:5000 flag maps port 5000 on your host machine to port 5000 inside the container, allowing you to access the service at <http://localhost:5000>.
- Billing & Authentication: The -e billing= and -e apiKey= lines are placeholder arguments that must be filled with your specific Azure resource endpoint and API key to track usage and bill your Azure subscription

➔ Setting up services billing endpoints extracting from azure ai platform

```
-e billing=https://di-wotjgmeslmnj4.cognitiveservices.azure.com/ \
➔ -e apiKey=dc6f81687ff745e5adbc7faef906af1a \
```

➔ When docker command is ready then executing it on terminal to start a new container

➔
